

VYLEX: MASTER STRATEGY & CONCEPT BRIEF

PART I: THE OVERARCHING VISION

There will be many ideas or ventures but all should have same ambition. Vylex will start with one sector. The level of the tech stack we want to dominate. The overarching ambition is to build **Foundational Digital Infrastructure with High Lock-In**.

The Big Picture: Building the "Unavoidable Utility"

Your ultimate ambition is to build a foundational, deeply embedded technology conglomerate in South Africa much like Naspers or Cassava Technologies, as you noted. You are completely abandoning the "Application Layer" (building software that people choose to use) in favor of the "Infrastructure Layer" (building the systems that other businesses and governments *require* to function).

You can think of Google, Amazon, Meta, Visa/Mastercard. The goal is absolute dependency. You want to build the digital roads, pipes, and power lines of the modern economy. By focusing strictly on B2B (Business-to-Business) and B2G (Business-to-Government), you are actively engineering high switching costs. If a client integrates your tech into their enterprise architecture or national procurement system, ripping it out later becomes economically unfeasible. You aren't building a product; you are building a monopoly on essential digital functions.

Not trying to build an app that people *choose* to use because it's trendy or convenient, but an underlying digital plumbing that businesses and governments *have* to use to survive, operate, and stay compliant.

Core Tenets of the Empire:

- **Unavoidable Utility:** You want to provide a service so fundamental that it functions like a utility company. Whether it's data hosting, logistics routing, or navigating POPIA and SARS compliance, if your system goes down, your clients' businesses stop.
- **The Infrastructure Pivot:** You explicitly noted moving away from the "Application Layer" to the "Infrastructure Layer." Applications (like a basic SaaS tool) can be easily swapped out for a cheaper competitor. Infrastructure, on the other hand, is deeply integrated and painful to rip out.

- **Economic Moats (Lock-In):** Your note to "make switching economically unfeasible" is the holy grail of B2B and B2G enterprise architecture. By handling long-term contracts, unified digital identities, or critical national infrastructure, you embed yourself so deeply into a client's daily operations that leaving you becomes a massive financial and operational risk for them.
- **Capitalizing on Local Constraints:** By targeting specific systemic friction points—like data localization laws, complex regulatory reporting (CIPC, B-BBEE), and loadshedding—you are positioning your business as the necessary bridge over regional market gaps.

Current Immediate Focus

What I am thinking of right now: Secondary to CIPC and bizportal, everyone who register a business go through them. I want to build a platform that every business that registers will need. We will make this a huge platform overtime expanding we can start small from anywhere. A central place where you can manage your registration documents like cor, b-bbee, and others compliance, notification on due dates and also automation. We can move to sector specific. Data localisation etc.

PART II: STARTUP CONCEPT BRIEF

ComplianceOS for South African SMMEs

A Vylex (Pty) Ltd Initiative

- **Prepared by:** Avuyile Mthembu
- **Role:** Founder & Managing Director, Vylex (Pty) Ltd
- **Date:** March 2026
- **Classification:** Internal Strategy Document — Confidential

EXECUTIVE SUMMARY

South Africa has approximately 3.1 million registered companies, yet up to 72% of them are non-compliant with basic regulatory requirements at any given time. This is not a demand problem. These businesses already need compliance — they are simply drowning in a fragmented, confusing, and siloed regulatory system that forces them to deal with multiple government entities simultaneously, each with its own portals, timelines, and penalties.

Vylex (Pty) Ltd proposes to build ComplianceOS — a unified, all-in-one compliance management platform purpose-built for South African SMMEs. The platform will serve as the single operating layer between small business owners and their regulatory obligations across the Companies and Intellectual Property Commission (CIPC), the South African Revenue Service (SARS), the Department of Employment and Labour (UIF and COIDA), and local municipalities.

The timing is strategically exceptional. The South African government announced in the 2026 Budget that the Turnover Tax threshold and the compulsory VAT registration threshold will both increase from R1 million to R2.3 million, effective 1 April 2026. This single regulatory shift expands the addressable market dramatically, as tens of thousands of businesses will need guidance, technology, and hand-holding to transition and stay compliant under the new framework.

The core insight driving this venture is simple but powerful: we do not need to create demand. The demand already exists. We simply need to capture it, simplify it, and serve it.

1. THE PROBLEM STATEMENT

1.1 The Compliance Web That Kills Small Businesses

Running a small or medium business in South Africa is an act of resilience. Beyond the day-to-day pressures of sales, staffing, and cash flow, business owners are expected to maintain active compliance across at least four separate government institutions, each operating independently, each carrying its own consequences for failure.

The compliance chain works as follows:

- **No valid Tax Clearance Status (TCS) pin → no payments received.**

A TCS pin from SARS is required by most corporate clients, government departments, and funders before they will release payment or enter into a contract. A single missed provisional tax submission, an unpaid penalty of as little as R100, or an outstanding PAYE liability can turn a green TCS pin red instantly — and the business owner often finds out only when a client refuses to pay.

- **No active CIPC registration → bank account risk and loss of legal standing.**

Companies that fail to file their CIPC annual returns face administrative deregistration. Once deregistered, the company technically ceases to exist as a legal entity. Banks have the right to freeze or close accounts associated with deregistered entities.

Contracts entered into by a deregistered company are legally precarious. Yet annual returns are due on the anniversary of incorporation — a date that varies for every business, is rarely communicated proactively by CIPC, and is therefore easily forgotten until the damage is done.

- **No B-BBEE affidavit or certificate → disqualified from tenders and corporate supply chains.**

Broad-Based Black Economic Empowerment compliance is a prerequisite for accessing government tenders and for being listed as an approved supplier by most large South African corporations. Qualifying SMMEs are entitled to use a sworn B-BBEE affidavit in lieu of a formal certificate, but many do not know this, do not know how to compile one correctly, or allow theirs to expire — costing them contracts they were otherwise qualified to win.

- **No COIDA Letter of Good Standing and no UIF registration → excluded from corporate contracts.**

The Compensation for Occupational Injuries and Diseases Act (COIDA) requires employers to register with and make contributions to the Compensation Fund. A valid Letter of Good Standing from COIDA is a standard requirement in corporate supplier onboarding processes. Similarly, failure to register employees for and pay Unemployment Insurance Fund (UIF) contributions exposes the business to liability and disqualifies it from certain formal contracting relationships. Both processes are paper-heavy, bureaucratic, and poorly digitized.

1.2 The Fragmentation Problem

The fundamental design flaw in South African SMME compliance is that no single authority owns or oversees the complete compliance picture. A business owner must independently:

- Create and manage a CIPC account for company secretarial obligations.
- Create and manage a SARS eFiling account for tax obligations.
- Register with and submit to the Department of Employment and Labour for UIF and COIDA.
- In some cases, register with and comply with local municipal bylaws, particularly for trading licences, health certificates, and signage.

These institutions do not communicate with each other. They do not share data. They do not send coordinated reminders. They operate on different timelines. They use different terminology. And they impose different penalties for non-compliance. The

burden of threading all of this together falls entirely on the business owner — who in most cases is also the salesperson, accountant, operations manager, and delivery driver of their own enterprise.

1.3 The Scale of the Crisis

The numbers tell the story clearly:

- Approximately 3.1 million companies are registered in South Africa.
- Up to 72% of those companies fail to submit CIPC annual returns on time.
- The majority of non-compliant businesses are not attempting to evade regulation — they are simply overwhelmed, under-resourced, and under-informed.
- Non-compliance directly blocks access to contracts, tenders, funding, and in extreme cases, the right to operate.

This means the market is not theoretical. The pain is real, widespread, active, and financially consequential. The demand for a solution does not need to be manufactured or educated into existence from scratch. It simply needs to be met.

2. THE MARKET OPPORTUNITY

2.1 Total Addressable Market

The primary target market is the estimated 3.1 million registered companies in South Africa, with a particular focus on formally registered SMMEs that are either currently non-compliant or struggling to maintain compliance across all regulatory requirements.

Within this base, the highest-priority segments are:

- **Active trading businesses with 1–50 employees** who have clients or customers that require compliance documentation (TCS pin, COIDA Letter of Good Standing, B-BBEE affidavit) as a condition of doing business. These businesses have the most immediate and financially consequential need for the platform.
- **Businesses transitioning under the 2026 Turnover Tax changes** — particularly those with annual turnover between R1 million and R2.3 million who are newly eligible for the simplified Turnover Tax regime and need guidance, automation, and tracking to make the transition correctly and remain compliant.
- **Businesses pursuing government tenders or corporate supplier registration** — a segment that requires the full suite of compliance

documentation and for whom non-compliance represents a direct and measurable loss of revenue.

2.2 The April 2026 Regulatory Catalyst

The 2026 Budget announcement represents a time-sensitive and strategically significant market entry window. Effective 1 April 2026:

- The Turnover Tax threshold increases from R1 million to R2.3 million — meaning qualifying businesses with turnover up to R2.3 million can elect to use the simplified Turnover Tax regime instead of standard income tax.
- The compulsory VAT registration threshold also increases to R2.3 million — meaning many businesses that were approaching or had crossed the old R1 million threshold no longer face mandatory VAT registration, which carries significant administrative overhead.

This creates a dual opportunity:

First, thousands of businesses that have been operating under standard income tax, or that have been incorrectly approaching mandatory VAT registration, will want to understand and potentially migrate to the simplified Turnover Tax system. They will need technology to help them calculate their turnover accurately, file the TT01 registration form, submit bi-annual TT02 and TT03 returns, and track their revenue against the new threshold.

Second, businesses nearing the R2.3 million threshold in the future will need to be warned in advance of the impending VAT registration obligation so they can prepare — rather than discovering the threshold breach retrospectively during a SARS audit.

ComplianceOS is uniquely positioned to be the automated bridge for both scenarios.

2.3 The "Tender and Funding" Revenue Driver

A powerful and underappreciated market dynamic in South Africa is the degree to which compliance is not merely a legal obligation — it is a commercial prerequisite.

Government tenders, corporate supply chain contracts, and alternative lender financing all require compliance documentation as a baseline condition.

This means non-compliance is not just a regulatory risk. It is a direct revenue blocker. A business that loses a R500,000 tender because its TCS pin is red, or that gets delisted from a corporate supplier panel because its COIDA Letter of Good Standing expired, has suffered a real and quantifiable financial loss.

This dynamic makes the value proposition of ComplianceOS exceptionally easy to articulate: the platform pays for itself the moment it prevents a single compliance-related revenue loss.

3. COMPETITIVE LANDSCAPE

3.1 Existing Players and Their Limitations

The South African compliance technology market has several established players, but none of them own the end-to-end SMME compliance lifecycle.

- **Company Secretarial (CIPC) Platforms:** Platforms such as InfoDocs and Konsise have built strong reputations in automating CIPC annual returns, maintaining share registers, and managing Beneficial Ownership filings. They serve an important function. However, their scope is limited to the CIPC layer of compliance. They do not address SARS tax status, labour compliance, B-BBEE documentation, or the broader compliance health picture. A business using these platforms is better served than one using nothing, but it remains incomplete.
- **Tax Guidance Platforms:** TaxTim is widely recognized as an accessible and plain-language guide to individual and basic corporate tax filing in South Africa. It has built a strong user base among individuals and small businesses navigating the SARS eFiling system. However, TaxTim does not integrate CIPC entity management, does not track company secretarial obligations, and does not address labour compliance or B-BBEE. It occupies the SARS layer without bridging outward.
- **Accounting Software:** Platforms like Xero and Sage provide financial record-keeping and can generate outputs used in tax filing, but they are not compliance platforms. They do not monitor regulatory deadlines, interact with government portals, or maintain compliance documentation.

3.2 The Blue Ocean

There is currently no South African platform that provides a single, unified compliance operating layer across CIPC, SARS, UIF, COIDA, and B-BBEE. No platform gives a business owner a single dashboard with a real-time, colour-coded compliance health score across all regulatory dimensions simultaneously.

This gap is the market opportunity. ComplianceOS enters not as a competitor trying to displace incumbents in their existing niches, but as the layer that connects and completes the compliance picture those incumbents leave unfinished.

4. THE SOLUTION: COMPLIANCEOS

4.1 Product Vision

ComplianceOS is an all-in-one compliance management platform designed specifically for South African SMMEs. Its core promise is simple: one dashboard, one score, one platform — for every compliance obligation your business carries.

The platform is not intended to replace accountants, tax practitioners, or company secretaries for complex matters. It is designed to handle the routine, recurring, deadline-driven compliance tasks that currently fall through the cracks — and to escalate proactively when professional intervention is genuinely required.

4.2 The Unified Compliance Dashboard

The entry point and anchor feature of the platform is a Unified Compliance Dashboard that displays the business's compliance health across all major regulatory dimensions using a traffic-light system:

- **Green** — compliant, no action required, next deadline clearly visible
- **Amber** — action required within 30 days, automated reminder issued
- **Red** — non-compliant or expired, immediate action required, escalation triggered

The dashboard tracks and displays status for:

- CIPC Annual Return (filed / overdue / deregistration risk)
- CIPC Beneficial Ownership (filed / outstanding)
- SARS Tax Clearance Status pin (active green / inactive red)
- SARS Provisional Tax submissions (up to date / overdue)
- Turnover Tax registration and return submissions (where applicable)
- UIF registration and contribution status
- COIDA registration and Letter of Good Standing validity
- B-BBEE affidavit validity and expiry date
- Municipal trading licence status (where applicable)

The dashboard gives the business owner — at a glance, at any moment — a complete picture of where their business stands and what needs to happen next.

4.3 Turnover Tax Tracker — The Competitive Hook

The Turnover Tax Tracker is the platform's most strategically significant feature, and the one most directly enabled by the April 2026 regulatory changes.

The tracker integrates with the business's accounting software (Xero, Sage) or directly with bank feeds to monitor cumulative annual revenue in real time. It performs the following functions:

- Tracks total turnover against the R2.3 million Turnover Tax threshold.
- Automatically alerts the business when turnover approaches the threshold, prompting preparation for mandatory VAT registration.
- Guides eligible businesses through TT01 Turnover Tax registration with SARS.
- Automates calculation and filing reminders for bi-annual TT02 and TT03 returns.
- Advises on the tax liability differential between Turnover Tax and standard income tax, helping businesses make informed registration decisions.

This feature solves a pain point that is both technically straightforward and commercially consequential — making it the ideal acquisition hook for platform onboarding.

4.4 Automated CIPC Filing Module

The platform integrates with CIPC systems to automate the full annual return cycle:

- Automatically calculates the Public Interest Score (PIS) based on the company's financial and employee data.
- Identifies the correct annual return fee tier based on the PIS calculation.
- Prepares the AR submission for single-click filing and payment by the business owner.
- Maintains a complete record of filed returns, enabling the business to demonstrate CIPC compliance in tender applications and supplier onboarding processes.
- Monitors the company's CIPC registration status and issues proactive deregistration risk alerts.

4.5 Beneficial Ownership Management

The CIPC Beneficial Ownership register is a relatively recent and poorly understood compliance requirement, introduced as part of South Africa's response to international financial crime standards and its near-greylisting experience. Many businesses are unaware of the requirement, unaware of how to comply, or have filed incomplete or incorrect information.

The platform guides business owners through the BO filing process in plain language, validates submitted information, stores a permanent copy of all BO filings, and monitors for expiry or required updates.

4.6 B-BBEE Affidavit Builder

Qualifying SMMEs (generally those with turnover below R10 million) are entitled to use a sworn affidavit instead of a formal B-BBEE verification certificate. This is a significant cost saving — formal certificates can cost between R10,000 and R50,000 depending on the entity size and verifier used. However, most business owners do not know how to compile a compliant affidavit, do not know that the affidavit is legally sufficient, or allow their affidavits to expire without renewal.

The platform provides:

- A guided B-BBEE affidavit builder that walks the business owner through the correct legal requirements.
- A customized, print-ready affidavit document generated automatically based on the business's ownership and turnover data.
- Expiry tracking and renewal reminders.

4.7 Digital Compliance Document Vault

Every compliance engagement — whether a bank account application, a tender bid, a corporate supplier onboarding, or an alternative lender application — requires a standard package of compliance documents. Currently, business owners scramble to locate, update, and compile these documents for each engagement separately.

The Document Vault addresses this with:

- Secure, centralised storage for all compliance documents (FICA identity documents, CIPC certificates, TCS pin, B-BBEE affidavit, COIDA Letter of Good Standing, UIF registration confirmation, municipal licences).
- One-click generation of a fully populated and current "Vendor Application Pack" — a professional, formatted document package that can be sent directly to a client, bank, or funder.
- Validity tracking for all stored documents, with automatic alerts before expiry.

4.8 Labour Compliance Module (UIF and COIDA)

UIF and COIDA registration and compliance are among the most paper-heavy and poorly digitized compliance obligations facing South African SMMEs. The platform simplifies this with:

- Guided UIF registration for new employers.
- Monthly UIF contribution tracking and submission reminders (uFiling integration where possible).

- COIDA registration assistance and annual return reminders.
- COIDA Letter of Good Standing renewal tracking and alerts.

4.9 The Compliance Health Score

Underlying all modules is a single, proprietary Compliance Health Score — a numerical score out of 100 that reflects the business's overall compliance standing across all tracked dimensions. The score is weighted by consequence severity (e.g., a red TCS pin carries higher weight than an expired municipal licence) and is updated in real time as actions are taken and deadlines change.

The Compliance Health Score serves three functions:

- It gives the business owner an immediately understandable summary of their compliance posture.
- It creates a gamification dynamic that motivates action — business owners can track improvement as they resolve outstanding items.
- It creates a credentialing layer that can be shared with third parties (lenders, corporate clients) as a signal of trustworthiness and operational maturity.

5. BUSINESS MODEL AND MONETIZATION

5.1 Freemium — The Compliance Health Check

The acquisition funnel begins with a free Compliance Health Check. Any business owner can enter their company registration number and receive an immediate, automated diagnostic of:

- Their current CIPC registration status.
- Their CIPC annual return filing history.
- A summary of outstanding compliance obligations that the platform can help resolve.

This tool provides immediate and genuine value at zero cost, positions ComplianceOS as knowledgeable and trustworthy, generates a warm lead base of businesses with known and specific compliance deficits, and creates a natural and low-friction entry point into the paid product.

5.2 SaaS Subscription Tiers

- **Starter — R199/month:** Designed for sole traders and single-director micro-enterprises. Includes the Unified Compliance Dashboard, CIPC annual return tracking and reminders, TCS pin monitoring, and basic document vault storage.
- **Growth — R399/month:** Designed for small businesses with employees and more complex compliance needs. Includes everything in Starter, plus Turnover Tax Tracker, B-BBEE affidavit builder, UIF and COIDA tracking, and Vendor Application Pack generation.
- **Professional — R699/month:** Designed for businesses actively pursuing tenders and corporate contracts, or those with multiple entities. Includes everything in Growth, plus multi-entity management, priority document processing, API integrations with accounting platforms, and enhanced Compliance Health Score reporting for sharing with third parties.

5.3 Pay-As-You-Go Filing Fees

In addition to subscription revenue, the platform charges a transparent service fee for assisted government filings:

- CIPC Annual Return filing: R299 per return (plus the standard CIPC fee)
- CIPC Beneficial Ownership filing: R199 per filing
- COIDA registration assistance: R499 per company
- B-BBEE affidavit preparation: R350 per affidavit
- Turnover Tax (TT01) registration: R399 per company

These fees are positioned as a convenience and accuracy premium — the business owner pays for the assurance that the filing is handled correctly, submitted on time, and documented in the vault.

5.4 B2B Partnership and Referral Revenue

The Compliance Health Score and pre-vetted compliance status of platform users creates a valuable pipeline for financial services partners.

- **Alternative Lenders:** Partners such as Lulalend, Retail Capital, and Merchant Capital require compliance documentation as a prerequisite for loan applications. ComplianceOS can refer pre-verified, actively compliant businesses directly to these lenders and earn an origination fee on successful loan disbursements. The value proposition to the lender is a pre-qualified, compliance-verified pipeline that reduces their own due diligence burden.

- **Insurance Providers:** Business insurance providers — particularly those offering commercial, liability, and employer's liability cover — benefit from verified compliance data. Partnership arrangements can generate referral revenue while providing genuine value to platform users.
- **Accounting and Legal Firms:** ComplianceOS is not designed to replace accountants — it is designed to handle the recurring, automated layer of compliance that currently consumes disproportionate time in accounting engagements. Referral partnerships with accounting firms can drive platform adoption while allowing those firms to focus on higher-value advisory work.

6. GO-TO-MARKET STRATEGY

6.1 Phase One — *Launch and Awareness (April–June 2026)*

The April 2026 Turnover Tax threshold changes provide a hard and timely hook for initial market entry. The go-to-market strategy for Phase One centres on:

- **Content marketing and search dominance:** Publishing plain-language, high-value content around the April 2026 regulatory changes — "What the new Turnover Tax threshold means for your business," "How to register for Turnover Tax in 2026," "CIPC annual returns: what happens if you miss yours" — targeted at business owners actively searching for answers.
- **Free Compliance Health Check tool:** Launching the free check as a lead generation and brand awareness tool, distributed through social media, business owner communities, and WhatsApp groups. The tool converts instantly because it delivers real, immediate, actionable insight.
- **SMME community partnerships:** South Africa has an active ecosystem of SMME support structures — the Small Enterprise Development Agency (SEDA), Business Place, township business forums, and industry associations. Establishing early partnerships for platform access and co-branded onboarding within these structures provides immediate scale.

6.2 Phase Two — *Growth and Retention (July–December 2026)*

With an initial user base established, Phase Two focuses on conversion from freemium to paid, reduction of churn, and expansion of the average revenue per user through upselling and the introduction of pay-as-you-go filing services.

- **Onboarding optimization:** Investing in a high-quality, plain-language onboarding experience. Many target users are not financially sophisticated and may not be familiar with terminology such as COIDA, TCS, PIS, or UIF. The

onboarding journey must translate regulatory jargon into plain business language — "Is your business protected if an employee gets injured at work?" is more effective than "Are you COIDA registered?"

- **Automated compliance workflows:** Introducing workflow automations that reduce the number of decisions a user needs to make. The ideal platform experience is one where the business owner approves actions rather than initiating them — the platform identifies the required action, prepares the submission, and presents it to the owner for a single-click approval.

6.3 Phase Three — Scale and Market Leadership (2027 onwards)

- **Municipal integration:** Expanding coverage to include municipal trading licence tracking and renewal, particularly for businesses in high-growth urban municipalities.
- **Multi-entity management:** Building tooling for accountants, business advisors, and company secretaries managing compliance for multiple client entities simultaneously — creating a B2B SaaS offering layered on top of the core B2C platform.
- **API product:** Exposing the Compliance Health Score and compliance verification data via API to financial services providers, enabling ComplianceOS to become a compliance data infrastructure provider embedded in lending, insurance, and corporate procurement workflows.

7. EXECUTION RISKS AND MITIGATIONS

7.1 Government System Instability

The CIPC and SARS eFiling portals are notoriously unstable, particularly during high-traffic periods around filing deadlines. Outages, slow response times, and system errors are not exceptional events — they are recurring and predictable.

- **Mitigation:** The platform must be designed from the outset with resilience as a core architectural principle. All government-directed submissions should be queued, retried automatically on failure, and status-tracked with full auditability. If the CIPC system is offline at the moment a user initiates a filing, the platform must hold the submission in queue, continue retrying in the background, confirm submission when successful, and notify the user — without requiring the user to re-engage. Users must never lose confidence in the platform because of government system failures that are outside the platform's control.

7.2 Regulatory Changes

The South African regulatory environment is subject to ongoing legislative and administrative change. Threshold changes, new reporting requirements, changes to the B-BBEE framework, and updates to CIPC filing processes can all affect the platform's feature set and accuracy.

- **Mitigation:** Maintaining a dedicated regulatory monitoring function — a combination of automated monitoring of Government Gazette publications, relationships with tax practitioners and company secretaries, and a clear internal process for translating regulatory changes into platform updates within a defined timeframe.

7.3 User Education and Digital Literacy

A significant portion of the target market operates in environments where digital literacy is limited, English is not the first language, and trust in technology platforms handling financial and regulatory matters is not immediately given.

- **Mitigation:** Investing in multilingual onboarding content (isiZulu, Sesotho, Afrikaans, and isiXhosa at minimum), WhatsApp-compatible communication and reminder workflows, and a frictionless human support escalation path for users who need assistance beyond what the digital interface provides.

7.4 Data Security and Trust

The platform will handle sensitive business and personal information, including identity documents, tax numbers, company registration details, financial data, and beneficial ownership information. A data breach would be catastrophic for trust and potentially triggering of POPIA liability.

- **Mitigation:** Building on enterprise-grade cloud infrastructure with end-to-end encryption, strict access controls, regular penetration testing, and full compliance with the Protection of Personal Information Act (POPIA) from day one. Security is not a feature — it is a foundational requirement.

8. THE FOUNDING VISION

South Africa's small and medium businesses are the backbone of the economy, the primary employers in most communities, and the engine through which economic participation and ownership transformation will be achieved over the coming generation. They are also the businesses most likely to fail — not because they lack ambition or

capability, but because the system surrounding them was not designed to help them succeed.

Vylex (Pty) Ltd exists to change that.

ComplianceOS is not simply a software product. It is an infrastructure layer that levels the playing field — ensuring that a first-generation entrepreneur in Durban, Soweto, or Polokwane has the same visibility into their compliance obligations, the same access to a clean TCS pin, the same ability to present a credible Vendor Application Pack to a corporate client, and the same shot at a government tender as a business backed by a team of lawyers and accountants.

The market is ready. The regulatory window is open. The technology is buildable. The demand does not need to be created — it simply needs to be met.

Vylex (Pty) Ltd. Building the compliance infrastructure for South Africa's SMMEs.
